

RECONCILE

**Ante-Mortem & Post-Mortem Reconciliation System for
Disaster Victim Identification**

Connecting the missing to the unidentified through forensic evidence.

The Problem:

Can we make this reconciliation faster and more organized?

100

unidentified bodies

200

missing-person reports

20,000

manual comparisons

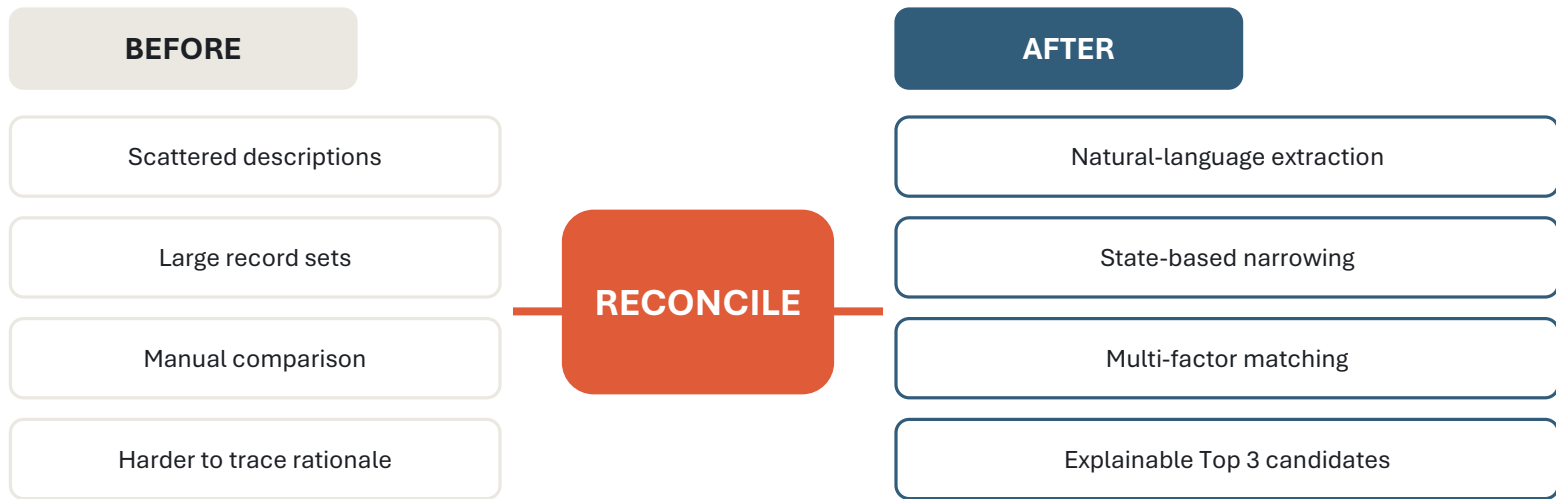

Imagine a major disaster where hundreds of people are missing and many victims remain unidentified. At the same time, families and witnesses are providing information (age, height, appearance, scars, clothing, dental details).

The challenge is that investigators may have to compare this information against a large number of unidentified-body records.

Example: 2023 Odisha Balasore train collision.

Our Solution:

Reconcile : from fragmented information to explainable potential matches.

Instead of manually going through records one by one, RECONCILE extracts the important information, searches the relevant records and produces potential candidates for investigator review.

Tech Stack & Impact

Streamlit

Web UI

Python

Logic & matching

Supabase

Database

Pandas

Data processing

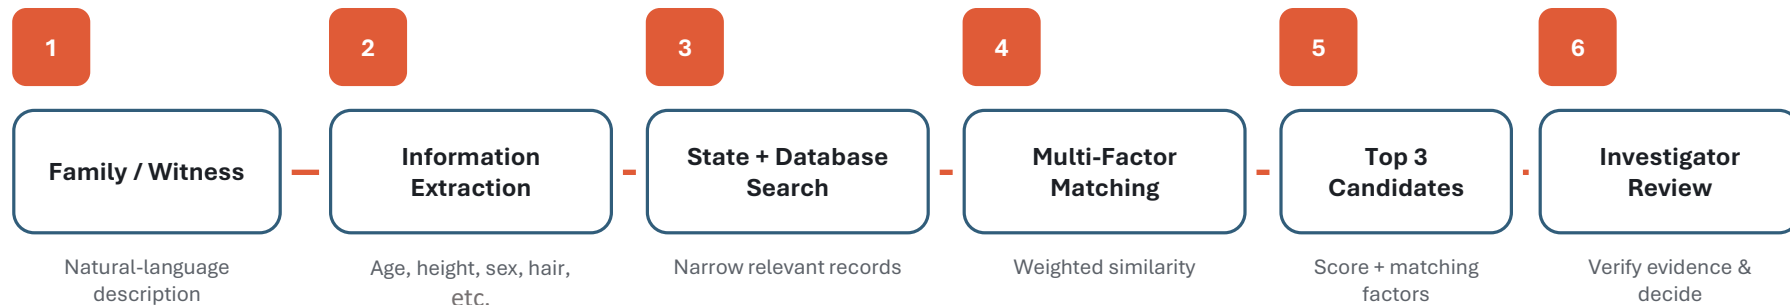

AI / NLP

Text extraction

Faster identification, less manual work, and quicker answers for grieving families.

HOW THE MODEL WORKS

A simple pipeline from witness/family input to explainable candidate records.

Prototype matching factors

Age 15	Height 10	Sex 15	Build 5	Hair 5
Scar 10	Birthmark 10	Clothing 5	Dental 10	DNA ref. 25

The score is a prototype software similarity score — not a forensic probability of identity.

Investigator & Admin Panels

Investigator

- Add/edit missing-person and body records
- Enter witness descriptions
- Search and run matching
- Review possible matches and history

Admin

- Dashboard with case statistics
- Database preview
- Investigation history
- Admin authentication

AI Description Extraction

WITNESS SAYS

"He was about 25, wearing a blue T-shirt and black jeans. He had a scar on his left hand and a small birthmark on his neck."

Age	25
Clothing	Blue T-shirt
Clothing	Black jeans
Scar	Left hand
Birthmark	Neck

Intelligent Matching

Missing person #M024: male, 25, blue T-shirt, black jeans, scar on left hand

Body #B017

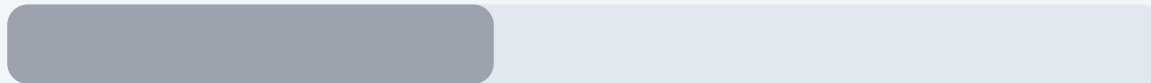

91%

Body #B032

64%

Body #B081

42%

A score assists investigators; final identification always rests on forensic evidence.

Summary

Problem

100+ unidentified bodies were matched by hand over 72 hours at Balasore, with no unified system.

Solution

Bob cross-references ante-mortem and post-mortem records and scores every pairing.

Output

Top 3 candidates per body with rationale, plus a reconciliation report.

Safeguard

Scores assist investigators; forensic confirmation makes the final identification.

Collect → Extract → Store → Match → Review → Identify
